CLAIMS

- 1. A method for the production of fractionally homogeneous compositions containing microcrystalline cellulose (MCC), comprising the steps:
 - (a) hydrolyzing cellulose-containing raw material with a catalytic system comprising at least one acidic catalyst in the presence of at least one process additive at about 0.1 to 10 catalytic system/cellulose weight ratio;
 - (b) neutralizing said acid with one or more precipitator in the manner that fine particles of insoluble ingredients precipitate into a slurry containing MCC;
 - (c) admixing at least one modifier; and
 - (d) homogenizing of the composition so that a MCC product characterized by a uniformly dispersed micro-particle cellulose material and various functional ingredients is obtained.
- 2. The method according to claim 1, wherein the acidic catalyst is a mineral acid.
- 3. The method according to claim 1, wherein the process additive is selected from acidic stable non-ionic wetting agent, oxidant or any mixture thereof.
- 4. The method according to claim 3, wherein the non-ionic wetting agent is a polyalkylenoxide polysiloxane or any of its derivatives thereof.
- 5. The method according to claim 3, wherein the concentration of the non-ionic wetting agent is in the range of about 0.02 to 0.20% (weight percent).
- 6. The method according to claim 3, wherein the concentration of the non-ionic wetting agent is in the range of about 0.05 to 0.10% (weight percent).
- 7. The method according to claim 3, wherein the oxidant is selected from potassium permanganate, hydrogen peroxide, sodium and/or potassium peroxides or any peroxide-containing mixture.

- 8. The method according to claim 3, wherein the concentration of oxidant is in the range of bout 0.5 to 5.0% (weight percent).
- 9. The method according to claim 3, wherein the concentration of oxidant is in the range of about 1.0 to 5.0% (weight percent).
- 10. The method according to claim 1, wherein the catalytic system comprising the acidic catalyst and process additive to cellulose weight ratio is in the range of about 0.5 to 5.0.
- 11. The method according to claim 1, wherein the catalytic system comprising the acidic catalyst and process additive to cellulose weight ratio is in the range of about 2.5 to 3.5.
- 12. The method according to claim 1, wherein the precipitator is selected from low-soluble carbonates, hydroxides and oxides, soluble basic silicates, salts of carbonic and fatty acids or any mixture thereof.
- 13. The method according to claim 12, wherein the salts of fatty acids are based on stearic acid, palmitic acid, oleic acid or any mixture thereof.
- 14. The method according to claim 12, wherein the precipitator also comprising one or more of the specific constituents that are characteristic of fillers, pigments, anti-blocking agents; lubricants; rheology adjusters or any mixture thereof.
- 15. The method according to claim 12, wherein the low-soluble precipitators comprise cations of calcium, barium or a combination thereof.
- 16. The method according to claim 1, wherein the precipitator is admixed to the acidic MCC-slurry so that a neutral pH of about 6 to 8 is obtained.

- 17. The method according to claim 1, wherein the modifier is selected from thickeners, dispersers, emulsifiers, anti-foaming agents, preservatives, biocides, pigments or any mixture thereof.
- 18. The method according to claim 1, wherein thickeners and/or dispersers are admixed such that a about 5 to 20% (weight percent) mixture is obtained.
- 19. The method according to claim 1, wherein thickeners and/or dispersers are admixed such that about 8 to 10% (weight percent) mixture is obtained.
- 20. The method according to claim 1, wherein preservatives and/or biocides are admixed such that about 0.1 to 2.0% (weight percent) mixture is obtained.
- 21. The method according to claim 1, wherein preservatives and/or biocides are admixed such that about 0.5 to 1.0% (weight percent) mixture is obtained.
- 22. The method according to claim 1, wherein the MCC product comprising solid content of about 1 to 50%.
- 23. The method according to claim 1, wherein the MCC product comprising solid content of about 10 to 30%.
- 24. The method according to claim 1, additionally comprising the step of spray-drying the uniformly dispersed micro-particle cellulose materials.
- 25. An MCC product characterized by uniformly dispersed micro-particle cellulose produced by a method comprising the following steps:
 - (a) hydrolyzing cellulose-containing raw material with a catalytic system comprising at least one acidic catalyst in the presence of at least one process additive at about 0.1 to 10 catalytic system/cellulose weight ratio;
 - (b) neutralizing said acid with one or more precipitator in the manner that fine particles of insoluble ingredients participates into a MCC containing slurry;

- (c) admixing at least one modifier; and
- (d) homogenizing of the composition so, that an obtained MCC product are characterizing with micron- or submicron-scale particles; uniform fractional composition having heterogeneity H-parameter of about 1 to 1.3, developed external specific surface more 1000 m²/kg and high crystallinity of the solid phase, of about 85 to 90%.
